

SEMA Certified - Emissions Compliance

PowerMax Direct Fit Performance Turbocharger

PN 739619-5004S | 1999.5 - 2003 7.3L Ford Power Stroke | Stage 1 Turbo Upgrade

The Federal Clean Air Act prevents the modification of vehicles with products that impact emissions unless the product has demonstrated a reasonable basis for claiming emissions compliance. The EPA's Tampering Policy provides guidance for such a demonstration, and SEMA Certified-Emissions is designed to provide documentation for assurance of 49-state legality.

What is emissions compliance? Emissions compliance applies to almost all performance and engine products. Generally, any product that affects airflow into or out of the engine, impacts the containment or delivery of fuel or affects the functionality of an emissions control system or device must demonstrate emissions compliance to be considered legal for street use. This includes, but is not limited to, intake systems, exhaust components, tuning products, intercoolers, turbos and superchargers.

Emissions compliance is a legal requirement. Both the state of California and the federal government have laws making it illegal for a company to sell performance products for street vehicles that could impact emissions. Products can comply with these laws by demonstrating it meets emissions compliance criteria.
